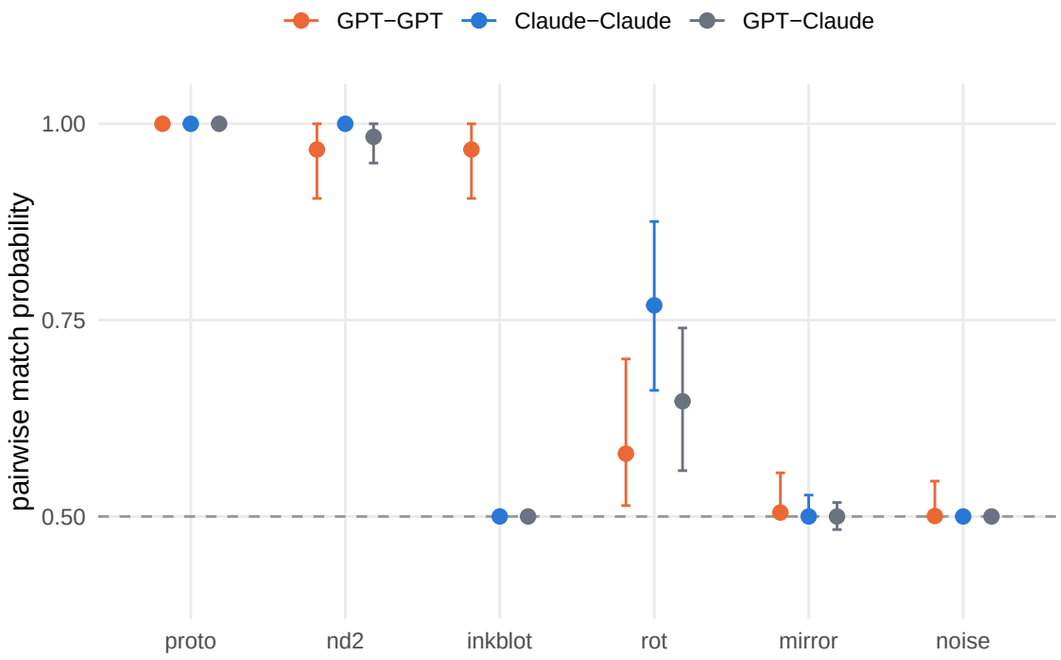
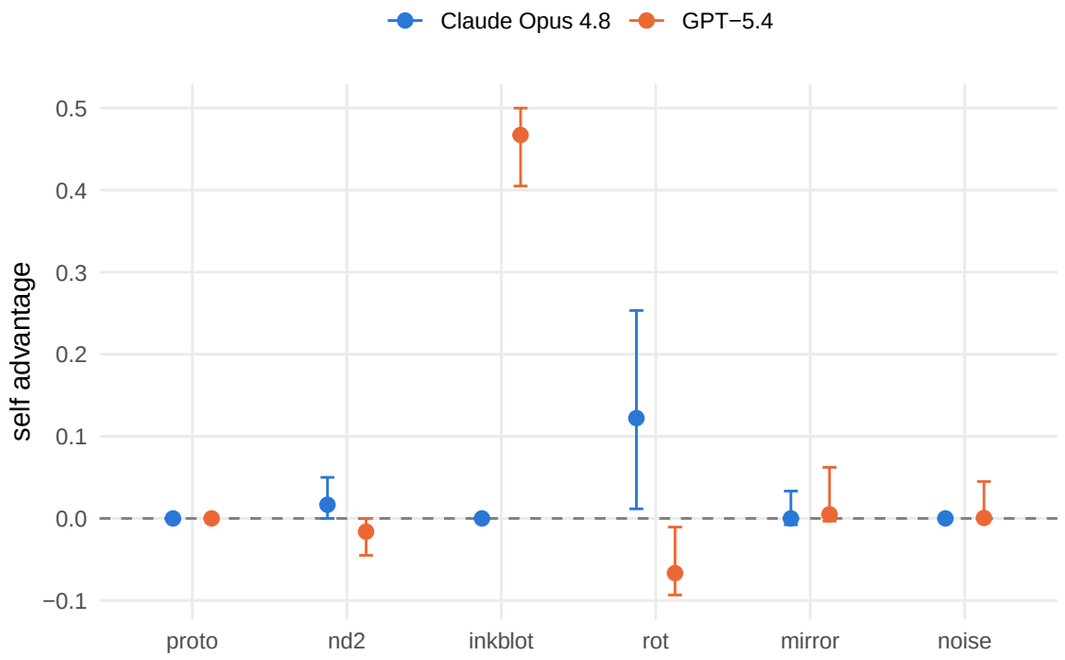
Partner−specific coordination: generic−framing ground−truth matrix

Arm−1 semantic choices (N=60/model/stimulus), match probs from marginals (not row−pairing); orientation−stratified bootstrap, 5,000 draws, 95% percentile CIs, seed 20260802.
Ground truth is under GENERIC 'another instance of you' framing; named−partner ground truth is recomputed in the follow−up.

A. Coordination matrix by stimulus (generic framing)

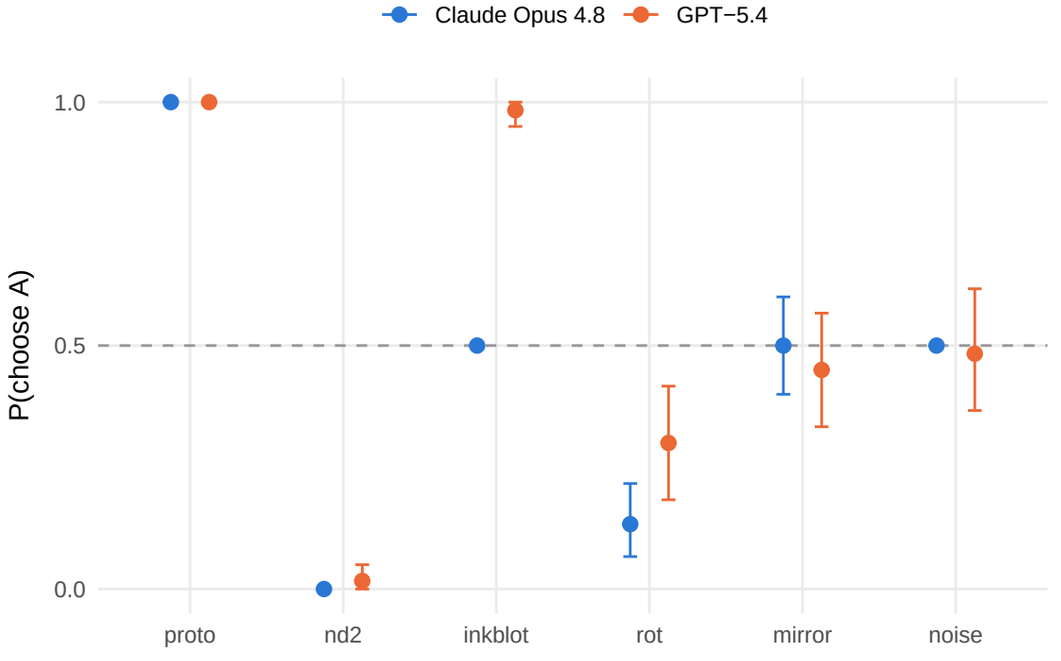


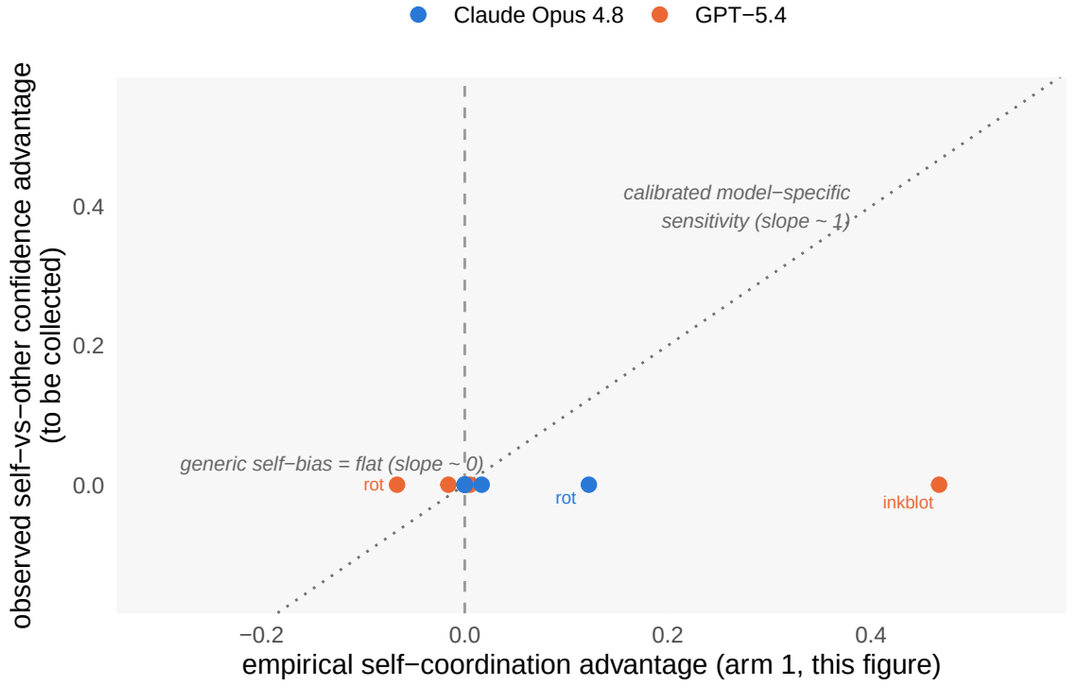
B. Self−coordination advantage (within − cross match)



C. Option−choice distribution P(choose option A) by model

0.5 = no modal focal point; extreme = strong shared focal option





D. Strongest−test schematic (y measured in the follow−up)
