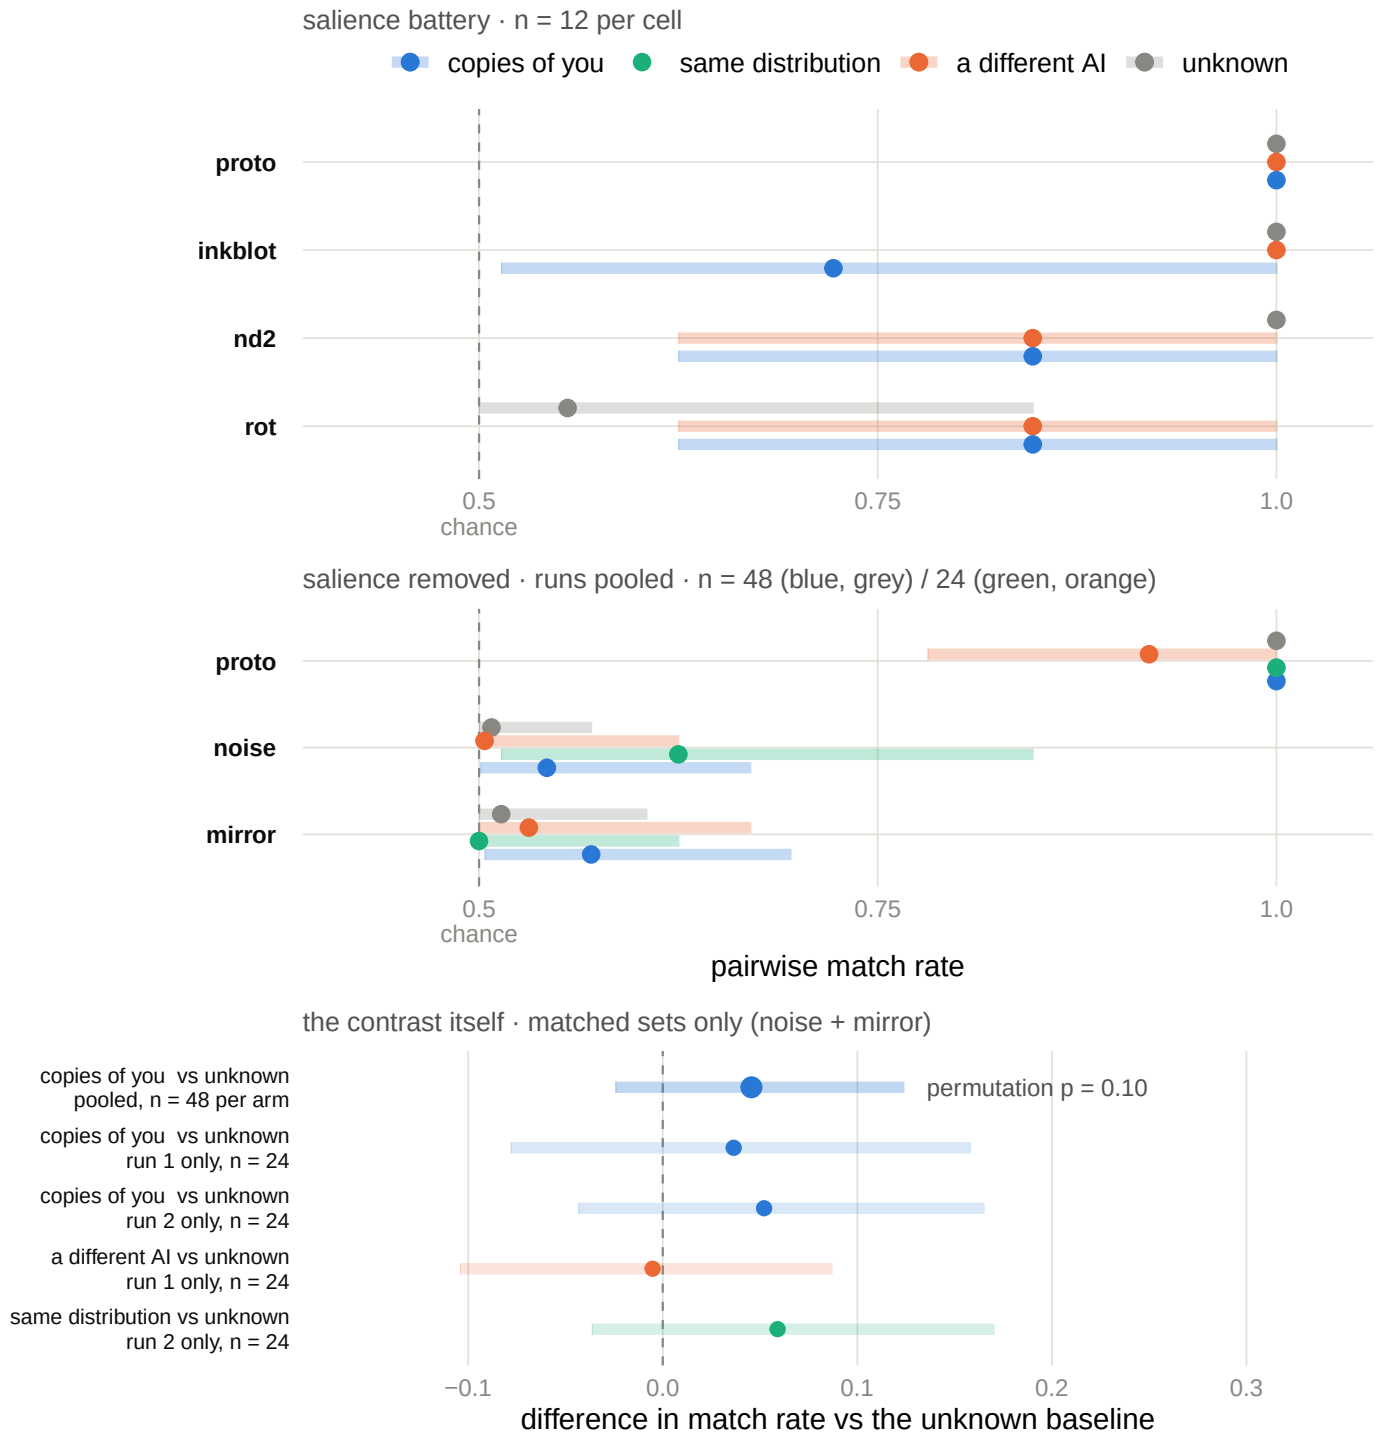
Coordination is set by the stimulus; identity moves it a little, if at all

GPT−5.4, 6 players, one shot, no communication · shape position randomized per player



Bars = 95% bootstrap CI (5,000 draws). Coordination = P(two independent draws agree); chance = 0.5.
Contrasts are the mean over matched stimuli of match(framing) − match(unknown); permutation test shuffles the identity label within stimulus (10,000 draws, one−sided).
